Coding Exercise

1. Coding Exercise

Goal is to implement a calendar for sport events. There should be a calendar view with the given events displayed. This can be just as a mark that there is an event on that day or already some information.

2. Detail Page

Also provide an option to show the whole information of one event in a detail page.

3. Add Event

The possibility to add an event on runtime should be given. It is not needed to save the data somewhere.

4. Responsiveness

The site should be fully responsive on mobile and tablet.

5. Navigation

Create a rudimentary navigation to switch between overview and the add event page

Additional filters can be added to the calendar presentation. We recommend hosting your code on GitHub as it allows us to see how you handle commits. Please send us the link to the repo you created after you have finished your solution (m.maritsch@sportradar.com)
